

IV. Making a Jig for your item

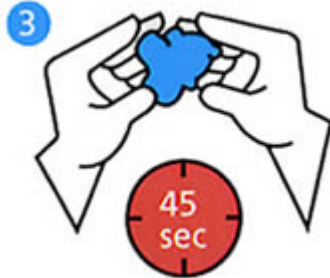

-Take a gulf ball size fixture putty.

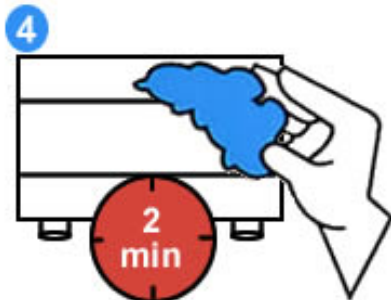

-Place the putty on your palm.

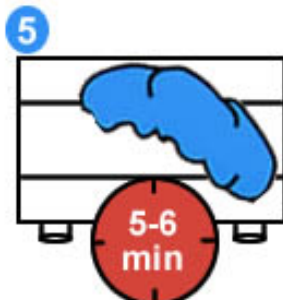

-Using the Hardener Gel Tube, pour 3-4 inches (8-10cm) out on to putty. (the more you add, faster it gets hard!)

-Mix the gel into the putty for around 45 seconds until the gel is completely dissolved with the putty.

-Place the Putty on the print table, and mold it to fit lock on the pad printer table. Put your imprintable item on the putty and make a deep mold. You will have about 2 minutes.

-Finally, let the imprintable item and the putty sit for about 6 minutes until the Fixture Putty has completely hardened.

-Remove the imprintable item and you are done.

Note: depending on how much hardener you use will determine how fast your putty will harden. So use putty, and hardener gel accordingly.
